The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itse can be used as a vaccine for the treatment of prostate cancer. The I was identified by analysis of a subtracted cDNA library with a normal tissue cDNA library.

Claim 1; Page 100; 141pp; English.

This sequence represents a human prostate tumour specific gene, and car

be used in the method of the invention. The method is for detecting

prostate cancer comprises contacting a biological sample with an agent

able to bind an immunogenic portion of a prostate protein (such as

encoded by this sequence). An antibody which binds to an immunogenic

portion of the prostate protein, and the method can be used to detect,

monitor progression of, or treat prostate cancers. The antibody may

also be conjugated to a therapeutic agent for use in therapy of prostate
                                 Polypeptides comprising immunogenic portions of prostate protein used in a vaccine for the treatment of prostate cancer Claim 3; Page 94; 130pp; English.
The present sequence is a new DNA which encodes an immunogenic prostate tumour protein. The encoded immunogen, or the DNA can be used as a vaccine for the treatment of prostate cancer. I was identified by analysis of a subtracted CDNA library obtained was identified by analysis of a subtracted CDNA library obtained by analysis of a subtracted con the treatment of the content of the content
subtracting a prostate tumour cDNA expression tissue cDNA library.
                                                                                                                                                                                                         Dillon DC, Xu J;

Computer readable the invention. The DNA sequences are recorded on a computer readable of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are clikely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The composition against S.aureus infection of S.aureus in asample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating computer readable medium.

The coding part of the gene contains at least the 5' part of DNA for tomato endochitinase and at least the 3' part of DNA for the tobacco enzyme (DNA can be genomic or cDNA, but at least one intron is pref. present). The recombinant gene includes the 35s promoter of cauliflower mosaic virus plus the terminator from the nopaline synthase gene of Agrobacterium tumefactens.

C The present invention describes a DNA molecule encoding a control of the present invention describes a DNA molecule encoding a pathogenesis-related (PR) protein having beta-1,3-glucanase activity celected from PR-2, PR-2, PR-N, PR-O and PR-O'. Also described are: (1) a chimeric gene comprising the above DNA molecule linked to a cherologous promoter; (ii) a vector containing the chimeric gene; (iv) a transgenic plant containing the chimeric gene; (iv) a transgenic plant. C containing the chimeric gene; and (v) a seed from the transgenic plant. The DNA molecule is used to produce transgenic plants with enhanced disease or pest resistance. The present sequence represents a tobacco basic beta-1,3-glucanase genomic DNA sequence.

cc a plant tissue. The method allows isolation of sequences which will be cuseful for the controlled expression of genes, under the control of a chemical regulatable sequence. This is useful in plants with a cc herbicide or pesticide detoxification mechanism under the control of a cc herbicide or pesticide to give optimal tolerance. The promoter fragment is useful in plants with a cc herbicide or pesticide to give optimal tolerance. The promoter fragment is useful for controlling sequences which encode traits such as the height, shape, development, male or female sterility, and the ability cof the plant to withstand cold, heat, salt and drought. The chemical cc induction of the promoter allows the regulation of production of compounds, e.g. flavours, fragrances, playments, natural sweeteners, industrial feedstocks, antimicrobials and pharmaceuticals, by compounds, e.g. flavours, fragrances, playments, natural sweeteners, cc industrial industrial sweeteners, cc industrial flavours, fragrances, playments, natural sweeteners, cc industrial sweeteners, by compounds, compounds, e.g. flavours, fragrances, playments, natural sweeteners, cc industrial sweeteners, cc industrial sweeteners, by compounds, cc industrial sweeteners, cc industrial sweeteners, cc industrial sweeten

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a clone of the tobacco beta-1,3-glucanas. This gene can be isolated using the method of the invention. The method is for isolating a chemically regulatable DNA promoter fragment from the 5' flanking region of a chemically regulatable of the chemically regulatable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         V74317;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences CC of the invention. The DNA sequences are recorded on a computer readable CC medium, preferably selected from a floppy or hard disk, random access CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so CC that protein-encoding or regulatory regions of commercial, therapeutic or Industrial importance can be obtained. Specifically, sequences which are CC likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The CC saureus in a sample. S.aureus is implicated in numerous human diseases, CC including cellulitis, eyelid infections, scalded skin syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences CC (and their fragments) are useful as primers or probes for isolating computer readable medium.

Sequence 3601 BP; 1170 A; 496 C; 738 G; 1057 T;

Claim 5; Page 21-2; 41pp; Japanese.
The present sequence represents a protein phosphatase gene sequence
of Saccharomyces cerevisiae. The specification describes new
S. cerevisiae in which the growth and/or the fermentation activity
is controlled at least in the range of 0-20 degrees Celsius. These
yeast are prepared by deleting the function of at least one protein
phosphatase gene. The yeast is useful in the production of dough.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687339, 726408-728711, and 729996-731399. Subtraction by Bento Coarga and w Faring Bonaldo.

with a modified polylinker; Plasmid DNA from the
normalized library NCI_CGAP_PT22 was prepared, and ss
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified CDNAs from a pool
of 5,000 clones made from the same library (cloneIDs
985608-986759, 1101192-1101959, and 1217928-12206I5).
